

## Intelligent, digital forms that work offline

ContinuumEdge® (CE) has built customized SmartForms – electronic forms with capabilities beyond traditional forms. Because they are intelligent and can work offline, these forms are a perfect solution for users in highly volatile industrial settings.

As part of the unique CE Mobile Solution, SmartForms deliver dynamic, complex forms (e.g. piping, cable and electrical), allowing mobile engineers to checkout and administer tasks for offline usage.

Think of these SmartForms as “digital paper”.

- Highly customizable
- Capable of electronic completions
- Dynamic sections
- Database calls
- Electronic submission
- Incorporate images
- Capture signatures

### SmartForms can be used COMPLETELY OFFLINE.

Users open dynamically created forms and fill them out. When Internet connectivity is available, the data from these forms is uploaded into the cloud (including images and signatures) and populates the database. The forms can be reopened for editing and/or scrubbed of data when new events or triggers require further action or follow up.

When connected to a database, these forms can be opened, filled-out on-screen, submitted (with fill data stored in the cloud), reopened for editing, routed via email and printed at various locations.

### CE SmartForms are intelligent because they are aware of situations, offline or connected.

For example, if an engineer fails a piece of equipment during an inspection, the SmartForm automatically asks the user to create a punchlist or non-compliance.

### The result is reduced administrative work, time, and cost - data input mistakes are virtually eliminated.

CE creates these forms – they are not hand-coded – which means seamless communication between the database and the forms. SmartForms do not repeat questions and include approval workflow for powerful change management. Worker Representative information is required, adding traceability to every procedure.
